Relational Model and Algebra

P.J. McBrien

Imperial College London

Relations are sets of typed tuples

Relations

Relations take the form R(A, B, ...) where

- R is the name of the relation
- $\blacksquare A, B, \dots$ is the set of attributes of the relation
 - Often write the set without commas: $A, B, \ldots \equiv AB \ldots$, and can refer to a set of attributes as \vec{A}
 - \blacksquare The number of attributes n is the **arity** of the relation Can call $R(A_1, \ldots, A_n)$ an *n*-ary relation
 - \blacksquare Domain(A) is the set of values (type) that the attribute can have
 - Will use Atts(R) to find A, B, ...
- The extent of R(A, B, ...) is the set of tuples $\{\langle v_1^A, v_1^B, \ldots \rangle, \langle v_2^A, v_2^B, \ldots \rangle, \langle v_3^A, v_3^B, \ldots \rangle, \ldots \}$
 - $\forall x.v_x^A \in Domain(A)$
 - No duplicate tuples
 - Not ordered
 - All tuples have the same arity

Relation=Table

Set Semantics

- Order of columns not significant
- Order of rows not significant
- No duplicate rows

- Attribute=Column
- Tuple=Row

Quiz 1: Equivalent Relations

- /	١.	
	7	

	branch

67	'Strand'	34005.00

Handling 'missing' attribute values

Suppose we want to have a relation account(no,type,cname,rate,sortcode), but not all accounts have a rate.

Solution 1: Separate relations

	account	
type	cname	sortcode
'current'	'McBrien, P.'	67
'deposit'	'McBrien, P.'	67
'current'	'Boyd, M.'	34
'current'	'Poulovassilis, A.'	56
'deposit'	'Poulovassilis, A.'	56
'current'	'Bailey, J.'	56
	'current' 'deposit' 'current' 'current' 'deposit'	type cname 'current' 'McBrien, P.' 'deposit' 'McBrien, P.' 'current' 'Boyd, M.' 'current' 'Poulovassilis, A.' 'deposit' 'Poulovassilis, A.'

accour	nt_rate
no	rate
101	5.25
119	5.50

Solution 2: NULL values

	account				
no	type	cname	rate	sortcode	
100	'current'	'McBrien, P.'	NULL	67	
101	'deposit'	'McBrien, P.'	5.25	67	
103	'current'	'Boyd, M.'	NULL	34	
107	'current'	'Poulovassilis, A.'	NULL	56	
119	'deposit'	'Poulovassilis, A.'	5.50	56	
125	'current'	'Bailey, J.'	NULL	56	

Relational Keys

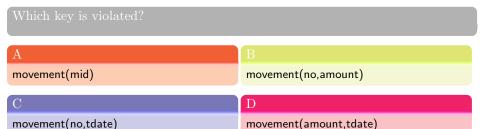

Key

A **key** of a relation R(AB...) is a subset of the attributes for which the values in any extent are unique across all tuples

- Every relation has at least one key, which is the entire set of attributes
- A key is **violated** by there being two tuples in the extent which have the same values for the attributes of the key
- \blacksquare If A is a key, then so must AB be a key
- A minimal key is a set of attributes AB... for which no subset of the attributes is also a key
- The primary key is one of the keys of the relation: serves as the default key when no key explicitly stated

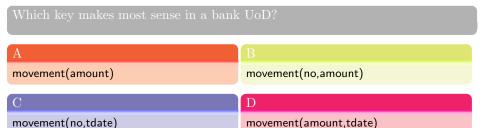

Quiz 2: Violation of Relational Keys

		movement	
mid	no	amount	tdate
1000	100	2300.00	5/1/1999
1001	101	4000.00	5/1/1999
1002	100	-223.45	5/1/1999
1004	107	-100.00	11/1/1999
1005	103	145.50	12/1/1999
1006	100	10.23	15/1/1999
1007	107	345.56	15/1/1999
1008	101	1230.00	15/1/1999
1009	119	5600.00	18/1/1999
			/-/

Quiz 3: Correct Keys for Relations

		movement	
mid	no	amount	tdate
1000	100	2300.00	5/1/1999
1001	101	4000.00	5/1/1999
1002	100	-223.45	5/1/1999
1004	107	-100.00	11/1/1999
1005	103	145.50	12/1/1999
1006	100	10.23	15/1/1999
1007	107	345.56	15/1/1999
1008	101	1230.00	15/1/1999
1009	119	5600.00	18/1/1999

Foreign Key

A foreign key $R(\vec{X}) \stackrel{fk}{\Rightarrow} S(\vec{Y})$ of a relation R(AB...) is a subset $\vec{X} \subseteq AB...$ of the attributes for which the values in the extent of R also appear as values of attributes \vec{Y} in the extent of S, and \vec{Y} is a key of S.

$account(sortcode) \stackrel{fk}{\Rightarrow} branch(sortcode)$

		account		
<u>no</u>	type	cname	rate	sortcode

Select Project Join (SPJ) queries

If a product of tables is formed, where a selection is then done that compares the attributes of those tables, we say that a **join** has been performed.

Normally not all columns of the product are returned, and therefore a project is also required.

Branches with current accounts

	$\pi_{bname,no}\sigma_{branch.sortcode=account.sortcode \land account.type=`current'(b)$	ranch imes account)

Rules for Combining Operators

Since all operators produce a relation as output, any operator may produce one of the inputs to any other operator.

well formed RA query

- the output of the nested operator must contain the attributes required by an outer π or σ
- the two inputs to a \cup or must contain the same number of attributes

Quiz 6: Well formed queries

		account

Equivalences Involving Project

Project and Project

 $\pi_{\vec{X}} \pi_{\vec{Y}} R \equiv \pi_{\vec{X}} R$ You can eliminate any inner project (note that to be well formed $\vec{X} \subseteq \vec{Y}$)

Project and Select

 $\pi_{\vec{\mathsf{X}}}\,\sigma_{\mathsf{P}(\vec{\mathsf{Y}})}\,\mathsf{R} \equiv \sigma_{\mathsf{P}(\vec{\mathsf{Y}})}\,\pi_{\vec{\mathsf{X}}}\,\mathsf{R}$

You can move a project of attributes \vec{X} inside a select, provided the select predicate can be answered from those attributes, *i.e.* $\vec{Y} \subseteq \vec{X}$

Project and Product

 $\pi_{\vec{\mathsf{X}}}(\mathsf{R} \times \mathsf{S}) \equiv \pi_{\vec{\mathsf{X}} \cap \mathsf{Atts}(\mathsf{R})} \, \mathsf{R} \times \pi_{\vec{\mathsf{X}} \cap \mathsf{Atts}(\mathsf{S})} \, \mathsf{S}$

Project and Union

 $\pi_{\vec{\mathbf{x}}}(\mathsf{R} \cup \mathsf{S}) \equiv \pi_{\vec{\mathbf{x}}} \, \mathsf{R} \cup \pi_{\vec{\mathbf{x}}} \, \mathsf{S}$

Project and Difference

 $\pi_{\vec{\mathsf{x}}}(\mathsf{R}-\mathsf{S}) \supseteq \pi_{\vec{\mathsf{x}}}\,\mathsf{R} - \pi_{\vec{\mathsf{x}}}\,\mathsf{S}$

Equivalences Involving Select

Select and Project

 $\sigma_{\mathrm{P}(\vec{\mathrm{X}})}\,\pi_{\vec{\mathrm{X}}}\,\mathrm{R} \equiv \pi_{\vec{\mathrm{X}}}\,\sigma_{\mathrm{P}(\vec{\mathrm{X}})}\,\mathrm{R}$

Select and Select

 $\sigma_{\mathsf{P}_{\mathsf{X}}(\vec{\mathsf{X}})}\,\sigma_{\mathsf{P}_{\mathsf{Y}}(\vec{\mathsf{Y}})}\,\mathsf{R} \equiv \sigma_{\mathsf{P}_{\mathsf{X}}(\vec{\mathsf{X}}) \wedge \mathsf{P}_{\mathsf{Y}}(\vec{\mathsf{Y}})}\,\mathsf{R}$

Select and Product

 $\sigma_{P(\vec{X})}(R \times S) \equiv \sigma_{P(\vec{X})} R \times S \iff \vec{X} \subseteq Atts(R)$

You can move a select predicate $P(\vec{X})$ onto one of the relations inside a product provided $\vec{X} \subseteq Atts(R)$.

Select and Union

$$\sigma_{\mathsf{P}(\vec{\mathsf{X}})}(\mathsf{R} \cup \mathsf{S}) \equiv \sigma_{\mathsf{P}(\vec{\mathsf{X}})} \, \mathsf{R} \cup \sigma_{\mathsf{P}(\vec{\mathsf{X}})} \, \mathsf{S}$$

Select and Difference

 $\sigma_{P(\vec{X})}(R-S) \equiv \sigma_{P(\vec{X})} R - S$

Quiz 12: Equivalent RA Expressions (Unary Operators)

Which RA expression is not equivalent to the other three?				
A	В			
$\pi_{no}\sigma_{type='current'}account$	$\pi_{no}\ \sigma_{type='current'}\ \pi_{no,type,cname}\ account$			
$\int C$	D			
$\pi_{\text{no}} \sigma_{\text{type}<>\text{'deposit'}} \pi_{\text{no,type,cname}}$ account	$\pi_{\text{no}} \sigma_{\text{type}=\text{'current'}} \sigma_{\text{type}<>\text{'deposit'}} \text{account}$			

Quiz 13: Query Evaluation

Which RA means that the \times operator handles fewer tuples

Equivalences Involving Binary Operators

Product and Union

 $R \times (S \cup T) \equiv (R \times S) \cup (R \times T)$

Product and Difference

 $\mathsf{R}\times(\mathsf{S}-\mathsf{T})\equiv(\mathsf{R}\times\mathsf{S})-(\mathsf{R}\times\mathsf{T})$

Union and Product

 $R \cup (S \times T)$ unable to move \cup inside \times

Union and Difference

 $R \cup (S - T)$ unable to move \cup inside -

Difference and Product

 $R - (S \times T)$ unable to move – inside \times

Difference and Union

 $R - (S \cup T) \equiv (R - S) - T$

Quiz 14: Equivalent RA Expressions (Binary Operators)

Which equivalence does not hold?

A

$$(R \times S) \times T \equiv R \times (S \times T)$$

В

$$(R-S) - T \equiv R - (S-T)$$

 $\overline{\mathrm{C}}$

$$(R \cup S) \cup T \equiv R \cup (S \cup T)$$

D

$$(R \cap S) \cap T \equiv R \cap (S \cap T)$$

Worksheet: Equivalences Between RA Expressions

- I $\pi_{\text{no,type}} \sigma_{\text{sortcode}=56} \pi_{\text{no,type,sortcode}} \sigma_{\text{type}='deposit'}$ account
- 2 $\sigma_{\text{account.no}=\text{movement.no}}(\pi_{\text{no,cname}} \operatorname{account} \times \pi_{\text{mid,no}} \sigma_{\text{amount}>1000} \operatorname{movement})$
- $\sigma_{\mathsf{account.no} = \mathsf{movement.no}}(\pi_{\mathsf{no,cname,rate}} \, \mathsf{account} \, \times \\ (\sigma_{\mathsf{amount}} {\scriptstyle > 1000} \, \pi_{\mathsf{mid,no}} \, \mathsf{movement} \cup \sigma_{\mathsf{amount}} {\scriptstyle < 100} \, \pi_{\mathsf{mid,no}} \, \mathsf{movement}))$
- 4 $\pi_{\text{no,cname,tdate}} \sigma_{\text{amount}<0 \land \text{account.no}=\text{movement.no}}$ account \times movement

Quiz 15: Monotonic and non-monotonic operators

A monotonic operator has the property that an additional tuple put into any input relation which only cause additional tuples to be generated in the output relation.

A non-monotonic operator has the property that an additional tuple put into an input relation may remove tuples from the output relation

Which RA operator is non-monotonic?			
A	В		
π R	$R \times S$		
$oxed{C}$	D		
$R \cup S$	R - S		

Incremental Query Evaluation

Suppose we add rows Δ_R to extent of relation R so it becomes R'If we represent Δ_R as a relation (with the same attributes as R) then

$$R' = R \cup \Delta_R$$

$$\pi_{\vec{X}} R' \equiv \pi_{\vec{X}} R \cup \pi_{\vec{X}} \Delta_R$$

$$\sigma_{P(\vec{X})} \, R' \equiv \sigma_{P(\vec{X})} \, R \cup \sigma_{P(\vec{X})} \, \Delta_R$$

$$R' \times S \equiv (R \times S) \cup (\Delta_R \times S)$$

$$R' \cup S \equiv (R \cup S) \cup \Delta_R$$

$$R' - S \equiv (R - S) \cup (\Delta_R - S)$$

$$S - R' \equiv (S - R) - \Delta_R$$

Example: Query result after update to account (1)

 \blacksquare Suppose that we had already evaluated query Q

π bname,no σ branch.sortcode $=$ account.sortcode \wedge account.type $=$ 'current' (bra	nch imes account)
bname	no
'Goodge St'	103
'Wimbledon'	107
'Wimbledon'	125
'Strand'	100

2 If $\Delta_{account}$ is added to account to get account':

If thus if $\Delta_{account}$ is added to account, we only need evaluate $\pi_{bname,no} \sigma_{branch,sortcode} = account.sortcode \land account.type='current' (branch <math>\times \Delta_{account}$)

 $[\]pi_{\mathsf{bname},\mathsf{no}}\,\sigma_{\mathsf{branch}.\mathsf{sortcode}=\mathsf{account}.\mathsf{sortcode} \land \mathsf{account}.\mathsf{type}=\mathsf{`current'}(\mathsf{branch} \times \mathsf{account'})$

 $[\]pi_{\mathsf{bname},\mathsf{no}}\,\sigma_{\mathsf{branch}.\mathsf{sortcode} = \mathsf{account}.\mathsf{sortcode} \land \mathsf{account}.\mathsf{type} = `\mathsf{current}`}((\mathsf{branch} \times \mathsf{account}) \cup (\mathsf{branch} \times \Delta_{\mathsf{account}}))$

 $[\]pi_{bname,no} \ \sigma_{branch.sortcode} = \text{account.sortcode} \land \text{account.type} = \text{`current'} (branch \times \text{account}) \ \cup \\ \pi_{bname,no} \ \sigma_{branch.sortcode} = \text{account.sortcode} \land \text{account.type} = \text{`current'} (branch \times \Delta_{account})$

Example: Query result after update to account (2)

4 Suppose we have

		$\Delta_{account}$		
126	'business'	'McBrien, P.'	1.00	67
127	'current'	'Pietzuch, P.'	NULL	34

Then

$\pi_{bname,no}\sigma_{bi}$	oranch.sortcode=account.sortcode∧account.type='current'(branch)	$\times \Delta_{account}$
bname		no
'Goodge St	t'	127

5 Thus since $Q' = Q \cup \Delta_Q$

	unt')	
	$\pi_{ ext{bname,no}} \sigma_{ ext{branch.sortcode} = ext{account.sortcode} \land ext{account.type} = ext{`current'} (ext{branch} imes ext{account.sortcode})$	no
	'Goodge St'	103
	'Wimbledon'	107
	'Wimbledon'	125
	'Strand'	100
	'Goodge St'	127
